

My research stay at the Bioinformatics Center, Institute for Chemical Research, Kyoto University, May 30 - Aug 23, 2013.

Hongmin Cai, Associate Professor, South China University of Technology, Guangzhou, Guangdong, China.

The purpose of this visiting was to conduct collaborative research on feature selection for high dimensional data via local hyperplane approximation. During the time stay, we conducted on extensive experiments on gene microarray data and have finished a joint paper, which has been submitted to Bioinformatics for reviewing. I also gave two talks to have a deep communication with the lab members by showing my current research activities. Under the help of Dr. Hayashida, Dr. Tamura, Prof. Jansson and other team member, I have a solid and deep impression on the research activities of this Lab. The dynamic, young but productive and active group taught me many new activities related to bioinformatics, such as network modelling, protein structure analysis.

The work experience was definitely a precious experience for my work. The spirits, enriched in the team members, like dedication, frankness, diligence, team-working and friendly personalities touched me deeply.

Finally, I would like to thank Prof. Akutsu for his support on this visiting and hospitalities during the visiting time. I had a fruitful time in this Lab and I hope I can visit this Lab again to conduct more joint works!
