

**My short research stay at the Institute for Chemical Research,
Kyoto University, Oct 14 – Nov 15, 2014**

Zhi-Chao Yan (Ph.D student), Institute of Chemistry, Chinese Academy of Science,
Beijing, China.

The purpose of this stay is to have collaborative research with Prof. Hiroshi Watanabe on the dynamics of star/linear polymer blends. During my stay, I have attended a rheological conference and conducted some experiment on measuring the molecular weight of my polymer samples. I also had some deep discussions with Prof. Watanabe and other lab members about the analysis of experimental data and some other issues. Under the kind help of lab members, I got an excellent experience on the research activities of this lab. This world-class rheological group taught me a lot of new ideas to do research about data analysis, experimental technique, and lab safety.

This short stay is a precious experience for my future work, not only because I learned a lot from the lab, but also the friendship I got during my stay. The kindness, hospitality, and team-working of the lab members really touch me deeply.

Finally, I especially thanks to Prof. Watanabe for his support on this visiting. I also want to thank all lab members for their hospitalities and help during my stay. I hope I can visit this lab again for the possible collaborative research in the future.
